Mitosis - Wikipedia

Controlling relative daughter cell size is key during cytokinesis. Uncontrolled size asymmetries can lead to aneuploidy and division failure. At the same time.

How do cells divide? - Genetics Home Reference - NIH

Daughter cells are produced after a single cell undergoes cell division. During mitosis, one pair of daughter cells is created after one round of DNA replication.

daughter cell | Example sentences

At the completion of the mitotic cell cycle, a single cell divides forming two daughter cells. A parent cell undergoing meiosis produces four daughter cells. Mitosis is the stage of the cell cycle that involves the division of the cell nucleus and the separation of chromosomes.
